

After Sales & Service

Safeguard the value of your machines and installations

Original spare parts

Only original parts from KBA-MetalPrint safeguard the value of your equipment.

Original parts from KBA-MetalPrint are not only developed by our own design department, but also manufactured to the highest quality standards. Only in that way are we able to ensure the legendary reliability of our products.

In Stuttgart, we maintain a technical archive of all machines and installations supplied by Mailänder, LTG and Bauer+Kunzi. Together with the close interaction between our spare parts, design, procurement and production departments, this establishes all the prerequisites for precise, focussed quotations and fast parts deliveries.

We supply original spare parts for

- Mailänder and LTG coating machines
- Mailänder printing presses
- MetalStar multicolour printing presses
- Sprint multicolour printing presses
- LTG ovens
- LTG air purification systems

The staff of our spare parts team pair a sound technical background with extensive practical experience.

Upgrades, E-Upgrades

Enhance the productivity and flexibility of your line

We have developed a whole series of upgrades to enable you to match your machine to changing production conditions. Upgrades are similarly available for the electronic control system; after all, electronic components are not immune to aging!

Upgrades

- VacuMatic belt infeed system for coating machines of types 460, 4040 and 470
- ColorTronic remote inking control system for printing presses of type 122
- Pneumatic rear-edge sheet guide for MetalStar presses
- Front lay sensors for Sprint presses
- Burner control for LTG ovens
- Dynamic sheet control for LTG loading machines
- MagStack magnetic overhead brake for LTG stackers

E-Upgrades

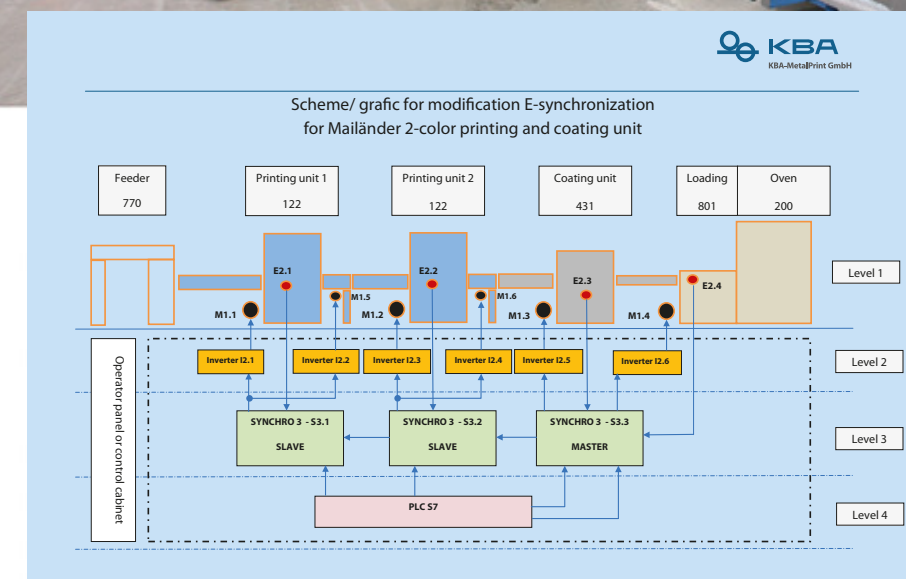

- Siemens S7 controller for Mailänder printing presses and coating machines
- Frequency drive for printing presses of type 121

Please request our detailed upgrades catalogue.

Line optimisation

Relocation – Modernisation – Optimisation

KBA-MetalPrint has gathered many years of experience in the relocation of entire production lines, not to mention the overhauling and modernisation of individual presses and machines. In many cases, it is possible to raise the performance of an existing line, especially where an investment in a new line is not planned before the medium to long term. Our project managers ensure efficient realisation and a smooth transition.

Line optimisation

- Relocation of machines and installations
- Modernisation and overhauls
- Electronic synchronisation
- Productivity enhancement
- Reduced energy consumption
- Project planning and project management

Customer service

Secure line availability and avoid ad-hoc costs

With our own team of field service staff, we are in a perfect position to provide maintenance for your machines and installations, for example within a frame contract. Our specialists find the ideal solution for even the most complex cases, not least because they work hand in hand with the design department.

Safety checks for our LTG ovens are inherent to safe and reliable line operation.

The remote maintenance functionality often permits us to determine the problematic component in advance. An attending service technician can then already carry the appropriate spare part. In many cases, it is even possible to solve problems without an actual site visit.

Remote maintenance

- Via the Internet

Remote maintenance is used especially in connection with our MetalStar metal decorating presses. In the meantime, however, remote maintenance is also possible for our coating machines and ovens.
