Upgrade 10.1

Simultaneous Adjustment of the Pressure Cylinder for Coating Machines – All at Once!

At Koenig & Bauer, we are working continuously on innovations to further improve your printing and coating lines. With our hardware upgrades you stay up-to-date with the latest technological developments. In that way you continue to decorate metal sheets to the highest standards.

The adjustment of the pressure roller to the rubber cylinder is decisive to adjust the required amount of coating as well as for a continuous and even application of coating. The conventional eccentric design requires two operators (drive side and operator side) to adjust the pressure roller.

With the simultaneous adjustment of the pressure roller the setting of the pressure roller to the rubber cylinder is carried out centrally from the operator side by only one person. Scale markings ensure a quick and accurate setting within shortest time.

Your benefits

- Highest production quality
- Less waste sheets
- More uptime due to shorter make-readies

The simultaneous adjustment of the pressure cylinder is available for coating machines 430 and 460.

Installation and commissioning of the upgrade to be performed by a qualified service technician from Koenig & Bauer. The labour, travel and accommodation costs, as well as daily travel allowances for the technician, will be charged separately as incurred.

We would be pleased to send you an individual offer quoting an attractive price.
